

PROFESSIONAL TRACTOR ATTACHMENTS FOR SURFACE MAINTENANCE

Why choose a Kersten sweeper?

Detritus build up is one of the largest causes of weeds on hard surfaces. Sweeping this detritus is our first line of defence against weeds.

Kersten sweepers have been specifically designed to remove soil and heavy debris on hard surfaces. This is achieved by several very important design features that are not typically found on other sweepers.

The brush – We use 5 spiral rows of bristles on our roller brush. The gaps between the rows provide space for movement of larger volumes of heavy debris. The spiral pattern allows pressure to be applied across a narrow section of the brush rather than the full width. Less power is required to move heavy material at this point, than across the whole brush at once, so the brush can tackle much heavier material than other brushes.

Height adjustment – The pressure of the brush can be finely adjusted on the rear castors, which prevents unnecessary brush wear and allows the brush to maximise performance on a range of surfaces. The two castors also allow the brush to follow contours closely to keep as much contact with the ground as possible.

Angling – The brushes can be angled to sweep forward, left or right. This allows material to be collected or wind-rowed

Our sweepers can be fitted with a range of accessories for making the job even easier;

Collector boxes – A height adjustable container can be fitted to the sweeper in order to collect material that has been swept. The box is sized so that it can be handled by one operator and is perfect for the collection of heavy debris such as soil, moss and sand.

Gully brush – A side brush can be fitted for presenting gullies. The brush pulls material out from the edges into the path of the main brush, so it can be collected.

This really makes an impact on a site and draws the eye to the crisp clean edges.

Brush guard – A brush guard can be fitted to our sweepers instead of the collecting box.

This prevents dust and debris being flicked into the air by the brush. Instead the material is contained close to the brush. This is extremely useful when trying to wind-row material.

HYDRAULIC DRIVE
(recommended flow rate is 50L/min.)

- **KM 25060 H** with 250cm
- **KM 27060 H** with 270cm

Front Mounted Sweeper:

- Hydraulic Drive
- Inboard hydraulic motor with self adjusting duplex chain to brush
- Substantial steel folded frame construction
- Brush diameter 60cm
- 2 heavy duty support wheels 200x80cm with single lever height adjustment
- Sweeping left and right on 400mm bearing
- 3 function hydraulic valve block for sweeping with collecting con-tainer open or closed
- Including jack stands to support the sweeper when not connected to power unit
- Supplied with 2 section, 5 row Combi brush
- Requires ABR Mounting Bracket

... Or a Kersten WeedBrush?

When moss and weeds become established on hard surfaces they are difficult to remove with a sweeper. For this application we have made the Weedbrush.

Kersten WeedBrushes have been designed to quickly remove weeds and moss, along with the soil they grow in from hard surfaces like tarmac and block paving. We achieve this with several features not typically found on other Weedbrushes.

VersaBrush – The WeedBrush is fitted with VersaBrushes. These brush sections are composed of two wire types. Thick flat wires are used to cut the weeds and soil from the surface and removes the material; like using many tiny shovels. Thinner wire then sweeps the surface clean. The more soil that we can remove the longer the surface will remain free of weeds.

Angling – The WeedBrush can be angled in all directions for getting into cracks and crevices'. Using the brush on an angle allows it to penetrate the joints in surfaces such as block paving and cope with cambers.

Pressure – Brush height and pressure is controlled by an adjustable castor wheel placed close to the brush and a weight on top. This allows the pressure to be adjusted to suit the application, achieving a perfect combination of cleaning performance and brush life.

Stone guard – To reduce stone throwing, our WeedBrushes rotate at very low speeds of between 180 – 400 rpm. Because of the high torque, we are still able to achieve a great finish, but the lower speed gives much less energy to stones and other debris so they are not turned into dangerous projectiles. A protective guard also helps to keep material close to the brush, so the arisings are easy to clean up after WeedBrushing. The slow rotation speed has the added benefit of creating less vibration.

Just add water.... – By adding water the WeedBrush is able to scrub dirt and algae from surfaces such as sandstone and other paving.
